Motor vehicle Products

Specification: 12V/24V

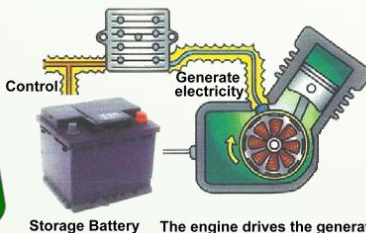

Lead-acid storage batteries are 100% crystallized throughout their life: Accelerate scrapping

About 80% of the failure of lead-acid storage batteries is caused by the crystallization of lead sulfate in the polar plate!

The crystallization of lead sulfate in the polar plate causes the internal resistance to rise, resulting in an increase in internal heat, an increase in internal pressure and loss of water, an increase in the acidity of the electrolyte, a decrease in capacity, and accelerate scrapping.

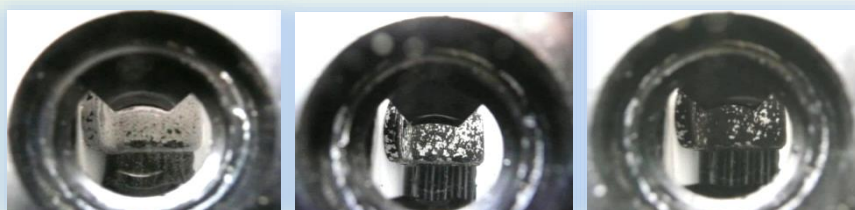

Other physical damage accounts for about 20% (non-repairable).

Low performance storage battery will increase fuel consumption, up to 6.4%.

Installing the Battery Desulfator will restore the capacity of battery and save up to 6.4% on fuel.

The desulfurization effect of the Battery Desulfator

Installation

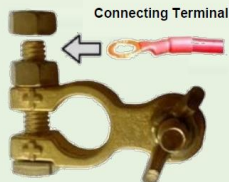

Connect the wires:

After confirming that the total basic voltage of the battery is consistent with the voltage of the household product, connect the positive side terminal of the battery with the red line, and the negative side terminal of the battery at the other end is connected to the black line and fixed.

Secure Battery Desulfator:

Put the connecting terminal of the product on the excess part of the fixing screw of the battery terminal clamp, and then screw the connecting terminal between the two nuts with another nut to ensure reliable connection.

*Ensure the connection of terminals are reliable.

Take care of your car, save money, reduce emissions

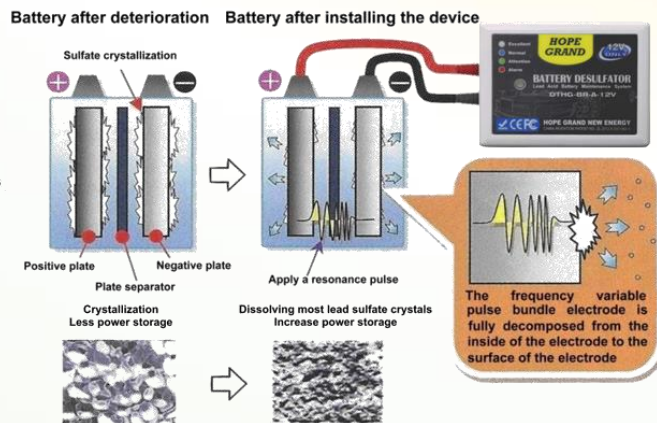

Low power consumption, Adaptive, Small size strong function, Easy to install and safe to use. Sulphur removal is 100% effective, capacity retention and recovery is remarkable, and the cost performance is high.

Patented product, the only one in the country, remarkable effect, 10 years warranty

Battery Desulfator: Intelligent pulse is used to activate and restore lead sulfate crystals back to the active substance, so that the lead-acid battery has the ultimate life and abundant energy.

How it works

Observe the sulfates on the surface of the electrodes under a microscope

The Battery Desulfator significantly improves the reliability and safety of lead-acid batteries, extends the service life by more than double, restores the capacity of the old battery, and the new battery is especially effective for wearing. The Battery Desulfator guarantees the performance of the vehicle, and replacing the battery less is equivalent to reducing carbon emissions by 13 kg. In the start-up type, energy storage type, power type has corresponding products, the effect remains effective for a long time.
